Composts & Soil Conditioners

1. How do I fix my clay soils?

Heavy clay soils hold too much water for most plants, and this leads to root rot and poor plant growth. Manured Sawdust is a product specifically designed to condition heavy clay soils. This product is a combination of pig manure and mineral components, which assist in breaking down the clay and improving the drainage of the soil.

2. How do I improve sandy soils?

Sandy soil is too free draining and requires the addition of well-composted organic matter to help hold moisture in the soil. The type of soil conditioner used will depend upon the type of plants being planted afterwards. Garden Gro, Bio Blend and Garden Soil Blend and will all improve the soil structure.

3. When should I add compost to my gardens?

There is no wrong time to add compost to your garden if you're planting new plants! Although spring and autumn are the busy planting seasons people garden year round, and it's poor practise not to add compost to the soil prior to planting. This encourages root growth into the newly enriched soil, and develops a stronger tree or shrub from day one!
